Acko's InsurTech Business Model and Digital Transformation in the Indian Insurance Industry

Introduction:

The rapid development of technology has brought significant changes to the financial services industry. Financial Technology (FinTech) refers to the use of modern technology to develop and improve financial products and services. FinTech has transformed several areas such as digital payments, banking, lending, investment, wealth management, and insurance. Among these emerging areas, InsurTech (Insurance Technology) has become an important part of the FinTech ecosystem. InsurTech involves the use of technologies such as artificial intelligence, machine learning, big data analytics, cloud computing, automation, and digital platforms to improve insurance services and customer experience.

Traditionally, the insurance industry has depended on physical documentation, intermediaries, manual processes, and lengthy procedures. Customers often had to visit insurance offices or depend on agents to purchase policies, make payments, and process claims. These traditional methods could be time-consuming and sometimes difficult for customers to understand. The emergence of InsurTech has changed these practices by providing digital solutions that make insurance services faster, simpler, and more accessible. Customers can now compare insurance policies, purchase products, make payments, receive policy documents, and access various services through websites and mobile applications.

The growth of digital technology has also changed customer expectations in the insurance industry. Today's customers prefer financial services that are convenient, transparent, quick, and easily accessible. Increasing smartphone usage, affordable internet connectivity, digital payments, and growing digital awareness have created favourable conditions for the expansion of digital insurance services in India. Consumers are increasingly becoming comfortable with completing financial transactions online, which has encouraged insurance companies to adopt digital platforms and technology-driven business models.

In India, the development of the digital ecosystem has created significant opportunities for InsurTech companies. Technology can help insurance companies improve operational efficiency, understand customer requirements, assess risks, reduce processing time, and provide personalised services. Data analytics can be used to understand customer behaviour, while artificial intelligence and automation can support different business processes. Digital platforms can also reduce dependence on physical distribution channels and provide customers with convenient access to insurance services. Thus, technology has become an important factor in the transformation of the Indian insurance industry.

Acko General Insurance is one of the companies that represents this technology-driven transformation in the insurance sector. Acko follows a digital-first approach and uses technology to simplify various insurance processes. Its digital platform enables customers to access

insurance services through online channels, reducing the need for traditional physical interactions. Customers can obtain information about insurance products, purchase policies, make payments, and access policy-related services through digital platforms. This approach demonstrates how technology can be integrated into different stages of the insurance value chain.

Acko's business model is particularly relevant to the study of InsurTech because it focuses on combining insurance services with digital technology. The use of digital platforms can improve convenience and provide customers with faster access to services. Technology can also support data-driven decision-making, risk assessment, customer communication, and process automation. By using technology as an important part of its operations, Acko demonstrates how a modern insurance company can respond to the changing expectations of digitally active customers.

One of the major advantages of InsurTech is its ability to improve customer experience and operational efficiency. Automation can reduce repetitive manual activities and minimise processing time. Data analytics can help companies understand customer preferences and develop suitable products. Artificial intelligence can support customer service and other insurance-related activities, while cloud-based systems can help organisations manage information efficiently. Mobile applications and online platforms further provide customers with access to insurance services from different locations. These developments contribute to the creation of a more customer-oriented insurance environment.

However, the adoption of InsurTech also involves several challenges. Insurance companies need to address issues related to data privacy, cybersecurity, regulatory compliance, customer trust, and technological risks. Insurance companies handle sensitive personal and financial information, making data security an important concern. At the same time, companies must follow the rules and regulations governing insurance products and customer protection. Building customer trust in digital insurance services is also essential for long-term growth. Therefore, InsurTech companies need to balance technological innovation with security, transparency, regulatory requirements, and customer satisfaction.

The increasing adoption of InsurTech is gradually transforming the traditional insurance industry into a more digital, efficient, and customer-focused sector. As technologies such as artificial intelligence, automation, and data analytics continue to develop, their role in insurance is expected to increase further. Digital transformation can influence how insurance products are marketed, purchased, managed, and serviced. Companies that successfully combine technology with customer needs can create better service experiences and strengthen their position in the competitive insurance market.

In this context, Acko provides a suitable case for understanding the role of InsurTech in the Indian insurance industry. Studying Acko helps to understand how a digital-first insurance company uses technology to improve its business operations and customer services. It also provides an opportunity to examine its business model, digital transformation, technological adoption, customer experience, competitive environment, challenges, and future opportunities.

Therefore, this case study focuses on “A Case Study on Acko's InsurTech Business Model and Digital Transformation in the Indian Insurance Industry.” The study aims to understand Acko's role in the digital transformation of insurance and examine how InsurTech is reshaping the future of the Indian insurance industry.

Objectives of the Study:

1.To study the InsurTech business model adopted by Acko General Insurance in the Indian insurance industry.

2.To analyse the role of digital technology in improving Acko’s insurance services and customer experience.

3.To examine the major challenges and opportunities faced by Acko in the digital insurance market.

4.To evaluate the contribution of Acko towards the digital transformation and growth of the Indian insurance industry.

Review of Literature:

Balaji and Ariwa (2024) :Balaji and Ariwa examined the growing influence of InsurTech on the conventional insurance industry. Their study highlighted how technology is changing the development, distribution, and delivery of insurance products. The authors explained that digital technologies can improve efficiency, customer convenience, and innovation in insurance services. This study provides a conceptual foundation for analysing Acko's technology-driven insurance model.

Gomber, Koch and Siering (2017): Gomber, Koch and Siering studied the broader development of Digital Finance and FinTech. They explained how technological innovations are transforming traditional financial services and creating new digital business models. Their study is relevant to Acko because digital insurance represents an important extension of the wider FinTech ecosystem.

Stoeckli, Dremel and Uebernickel (2018): Stoeckli, Dremel and Uebernickel examined the emergence of InsurTech and its impact on the insurance industry. Their research highlighted the role of digital technologies in transforming insurance processes and business models. The study suggests that InsurTech companies can create new opportunities by combining technology with customer-oriented insurance services.

EIOPA (2019):The European Insurance and Occupational Pensions Authority examined the increasing use of Big Data Analytics in insurance. The report discussed how data-driven technologies can support risk assessment, pricing, underwriting, and customer services. It also

highlighted concerns related to data protection and fairness. These findings are useful for understanding the opportunities and risks associated with technology-based insurance models such as Acko.

OECD (2020): The OECD examined the role of digital technologies in financial services and highlighted how digitalisation can improve access, efficiency, and innovation. The study also pointed out challenges related to cybersecurity, consumer protection, and data privacy. These factors are important when evaluating the digital transformation of insurance companies.

Swiss Re Institute (2020): Swiss Re Institute analysed the impact of digitalisation on the insurance sector and observed that technological developments are changing customer expectations and insurance distribution. The study highlighted the importance of digital channels and data-driven solutions in improving insurance services. This provides a useful basis for examining Acko's digital-first approach.

Deloitte (2021) :Deloitte studied the development of InsurTech and digital insurance and highlighted the importance of artificial intelligence, automation, analytics, and digital platforms. The study suggested that insurers need to adopt innovative technologies to improve operational efficiency and customer engagement. These observations are relevant to analysing Acko's technology-based business strategy.

McKinsey & Company (2022): McKinsey examined the transformation of the insurance industry through digital technologies and identified changing customer expectations as a major driver of digitalisation. The study highlighted the importance of simplified customer journeys, digital distribution, automation, and data analytics. This literature supports the study of Acko's customer-centric digital insurance model.

KPMG (2023): KPMG analysed technology trends in the insurance industry and emphasised the increasing importance of artificial intelligence, data analytics, automation, and cloud technologies. The study noted that these technologies can help insurers improve efficiency and develop more personalised services. It also highlighted the importance of cybersecurity and regulatory compliance in digital insurance.

IRDAI (2023): The Insurance Regulatory and Development Authority of India highlighted the importance of digitalisation, technology adoption, consumer protection, and innovation in India's insurance sector. The regulatory perspective emphasises the need for insurers to adopt technology while maintaining transparency, security, and customer protection. This provides an Indian regulatory context for studying Acko's digital transformation.

Company profile:

Acko General Insurance is a technology-driven general insurance company in India that follows a digital-first business approach. The company represents the growing use of InsurTech in the Indian insurance industry by combining insurance services with digital technology. Acko provides customers with access to insurance-related services through online platforms, reducing the need for traditional physical interactions.

Acko's digital platform allows customers to obtain information about insurance products, purchase policies, make payments, and access policy-related services through digital channels. This digital approach helps make insurance services more convenient, faster, and accessible to customers.

Technology is an important part of Acko's operations. The company uses digital platforms, automation, data analytics, and other technology-based solutions to support activities such as customer communication, risk assessment, decision-making, and insurance processes. These technologies can help reduce repetitive manual activities and improve operational efficiency.

Acko's digital-first approach also focuses on changing customer expectations. Modern customers prefer insurance services that are simple, transparent, quick, and accessible. By providing insurance services through digital channels, Acko aims to provide a more convenient customer experience.

Acko provides a suitable example for understanding the development of InsurTech in India. Its business model demonstrates how technology can be integrated into different stages of the insurance value chain, from product access and purchase to payment and policy services.

Business model:

Acko General Insurance follows a digital-first insurance business model, where technology is used as a major part of delivering insurance products and services to customers. The company provides insurance services through digital platforms, allowing customers to obtain information about insurance products, purchase policies, make payments, and access policy-related services online. This model reduces the need for traditional physical interactions and makes insurance services faster, simpler, and more convenient for customers.

Acko's business model also focuses on technology-based operations and customer experience. Digital technology supports various activities such as customer communication, risk assessment, decision-making, and process automation. Automation helps reduce repetitive manual activities and processing time, while data analytics can help the company understand customer behaviour and requirements. These technology-driven processes support better operational efficiency and customer-oriented insurance services.

Another important feature of Acko's business model is its digital distribution and accessibility. Instead of depending mainly on traditional physical channels, Acko uses digital platforms to provide insurance services to customers from different locations. This approach is suitable for

the growing number of customers who prefer convenient, quick, and easily accessible financial services. The increasing use of smartphones, internet connectivity, and digital payments creates favourable conditions for this type of insurance business model in India.

Overall, Acko's business model combines insurance services with digital technology to create a more efficient and customer-focused insurance experience. Its model demonstrates how InsurTech can transform traditional insurance processes through digital platforms, automation, data analytics, and technology-enabled services. Therefore, Acko serves as a relevant example of how digital transformation is reshaping the Indian insurance industry.

SWOT analysis:

SWOT Analysis is a strategic analysis tool used to identify the Strengths, Weaknesses, Opportunities, and Threats of an organisation. It helps understand both the internal and external factors that can influence a company's performance and future growth.

In the InsurTech industry, SWOT analysis is useful for understanding how technology-driven insurance companies respond to changing customer expectations, increasing competition, technological developments, and regulatory requirements.

For Acko General Insurance, SWOT analysis helps examine its digital-first approach, technology-based operations, customer convenience, and ability to use digital platforms for insurance services. At the same time, it helps identify challenges such as cybersecurity, data privacy, regulatory compliance, customer trust, and technological risks. These are important concerns for digital insurance companies because they handle sensitive personal and financial information.

Therefore, the SWOT analysis of Acko provides a clear understanding of its internal strengths and weaknesses as well as the external opportunities and threats in the Indian InsurTech market.

Strengths

•Digital-first insurance business model

•Easy and convenient online insurance services

•Faster policy purchase and service process

•Use of technology, automation and data analytics

•Reduced dependence on traditional physical channels

•Customer-focused digital experience

Weaknesses

•High dependence on technology and digital systems

•Limited face-to-face customer interaction

•Technical or system failures can affect services

•Customers need digital knowledge and internet access

•Building trust in completely digital insurance can be difficult

Opportunities

•Growing demand for digital insurance in India

•Increasing smartphone and internet usage

•Growth of AI, automation and data analytics

•Opportunity to provide personalised insurance services

•Expansion of the InsurTech market

•Increasing acceptance of digital payments and online financial services

Threats

•Cybersecurity risks

•Data privacy and data protection issues

•Increasing competition in the insurance and InsurTech market

•Changes in insurance regulations

•Rapid technological changes

•Customer concerns regarding digital security and trust

FINDINGS:

✓Acko follows a digital-first business model, using technology as an important part of its insurance services.

✓Digital platforms improve customer convenience by allowing customers to access insurance information, purchase policies, make payments, and manage policy-related services online.

✓Technology improves operational efficiency by supporting automation and reducing repetitive manual activities and processing time.

✓Data analytics and technology support better decision-making, including understanding customer behaviour, assessing risks, and developing suitable insurance services.

✓Growing digital adoption in India creates opportunities for Acko, particularly because of increasing smartphone usage, internet connectivity, digital payments, and digital awareness.

✓Customer expectations are shifting towards faster and simpler insurance services, making digital insurance platforms increasingly important.

✓Cybersecurity and data privacy are major challenges because insurance companies handle sensitive personal and financial information.

✓Regulatory compliance and customer trust remain important for the successful growth of digital insurance services.

✓AI, automation, and data analytics provide future growth opportunities for improving insurance operations and customer services.

✓Acko demonstrates the role of InsurTech in transforming traditional insurance, making the industry more digital, efficient, and customer-focused.

CONCLUSION:

The study concludes that Acko General Insurance is an important example of how technology is transforming the traditional insurance industry in India. Its digital-first business model makes insurance services more convenient, accessible, and customer-oriented. Through digital platforms, customers can obtain insurance information, purchase policies, make payments, and access policy-related services online.

The study also finds that technologies such as automation, data analytics, and digital platforms can improve operational efficiency, customer experience, and technology-based decision-making. The increasing use of smartphones, internet connectivity, and digital payments provides further opportunities for the growth of digital insurance in India.

However, Acko and other InsurTech companies need to address challenges such as cybersecurity, data privacy, regulatory compliance, customer trust, and technological risks. Therefore, successful digital transformation requires a balance between technological innovation, security, transparency, and customer satisfaction.

Overall, Acko demonstrates how InsurTech can make insurance services more digital, efficient, and customer-focused. With continued technological development and increasing digital adoption, InsurTech has significant potential to reshape the future of the Indian insurance industry.
